

# Quantum Communications and Networks(QU.50013)

## Exercise Set 1

Heewon Lee

Fall 2026

### Problem 1

The benefits of applying quantum technology come not from communication speeds, but rather the usefulness of sharing quantum states itself. **Quantum key distribution** (QKD) is one of them: to ensure computational security, we use the quantum mechanical principle that perfectly discriminating non-orthogonal states is impossible. Another is **quantum teleportation**, where unknown states can be sent far away, enabling distributed quantum computing systems. In both of these cases, qubits and ebits (entanglement) are the crucial quantum resources.

### Problem 2

For a qubit in a pure state

$$|\psi\rangle = \frac{\sqrt{3}}{2} |0\rangle + \frac{1}{2} |1\rangle,$$

measurement probabilities can be determined using the Born rule:

$$P(0) = |\langle 0|\psi\rangle|^2 = \frac{3}{4}, \quad P(1) = |\langle 1|\psi\rangle|^2 = \frac{1}{4}.$$
